

Complete security, privacy and control of your data begins with **EncryptPlus**

Highlights

- Manage encryption and policy enforcement across your entire enterprise from a single point
- Easily design and administer data access policies with customer-defined roles at the user and group levels
- Protect sensitive data with sophisticated cryptographic splitting technology
- Leverage integrated, transparent key management that conforms to regulatory requirements
- Be audit ready with user access and activity logs that seamlessly integrate into existing Security Information and Event Management (SIEM) systems

The “Protect Everything” Security Strategy

Organizations suffer every day from sophisticated cyber attacks, insider threats, and employee errors and omissions. These attack vectors, when successful, cost up to hundreds of millions of dollars to remediate.

Maintaining control of critical data is the only way to minimize exposure in the event of breach, and a data-centric management strategy must be employed across the enterprise to ensure your most sensitive data is protected.

The ideal data protection solution needs to encrypt data, but it also must provide robust access control capabilities across an entire infrastructure. The solution must be easy to deploy, administer and manage, and needs to scale quickly as the enterprise grows.

DataKeep focuses on these critical aspects of data protection and makes it easier to implement and manage a “protect everything” security strategy. A breadth of enhanced features covering data access management, integrated key management, and sophisticated encryption combine to deliver comprehensive protection, control, and integration to protect even the most sensitive workloads across the enterprise.
